

Wi-Fi rescue plug

Keep this plug. It brings your Shelly devices back online after a router change.

Only plug it in after you have changed your router. While the old router is running, the plug must stay unplugged.

When to use: You have a new internet provider or a new router, and your Shelly devices are offline.

1

Plug it in

In a socket in the middle of your home.

2

Connect your phone

To your **OLD** Wi-Fi name with your **OLD** password (see below). That network is now the plug.

Your phone may say “no internet” – choose to stay connected.

3

Open the plug

Type **192.168.33.1** in your browser.

4

Connect the plug to your new Wi-Fi

Settings → **Wi-Fi** → **Wi-Fi 1**: choose your new network, enter the password and tap **Save**. Your Shelly devices now come online through the plug.

5

Move the devices

In the **Shelly Smart Control** app: open a room → room menu → **Wi-Fi batch change** → **Select All** → **Wi-Fi 1** → enter your new network → **Save**. One room at a time.

6

Get it ready for next time

In the plug (**192.168.33.1**) under **Access point**: enter your new Wi-Fi name and password and tap **Save**. Unplug it and put it back together with this sheet.

 **Need help? Call your electrician.**
